Software Forward Deployed Engineer | CoLab Software

Cover letter

Computers felt like magic to me as a kid. I still like that moment when a tool makes something click, especially for someone who has spent too long working around a bad handoff.

At Office Evolution, receptionists needed to solve ordinary Wi-Fi problems without becoming network admins. I built them a portal for the common tasks and automated router and firewall setup with Node.js. The complicated part stayed underneath: a Linux routing system kept each customer office's access and bandwidth rules separate. At NuPrice, I owned a different kind of handoff. I built a repricing product that turned marketplace data and seller-defined rules into pricing decisions, and I supported the people using it after launch.

What caught my eye about CoLab is that you keep a record of why a design changed. That matters when several teams have to act on a decision months after the people who made it have moved on to something else. I'd like to work directly with engineering customers, understand how they review work today, and build the integrations that fit without making them run a second process alongside their real one.
